看门狗

3120104385 徐中豪 CS1202

配置内核中的硬件看门狗,使得一定时间内不喂狗就重启Acadia或 RPi或WRTnode,写一个程序或脚本保持一定频率的喂狗,当关闭这 个程序或脚本时形成重启。实验报告要记录和表现出重启。

实现目的

- 1 掌握看门狗的概念;
- 2 掌握Acadia或RPi或WRTnode上编写看门狗程序的方法。

实验器材

硬件

- Acadia或RPi或WRTnode板一块;
- 5V/1A电源一个;
- microUSB线一根;
- USB-TTL串口线一根(FT232RL芯片或PL2303芯片)。

以下为自备(可选)器材:

- PC (Windows/Mac OS/Linux) 一台;
- 以太网线一根(可能还需要路由器等)。

软件

- PC上的USB-TTL串口线配套的驱动程序;
- PC上的串口终端软件,如minicom、picocom、putty等;
- PC上的SSH软件,如putty等。

实验步骤

1 编写看门狗程序并编译;首先让硬件的看门狗模块运行起来

root@raspberrypi:/home/pi# modprobe bcm2708_wdog root@raspberrypi:/home/pi# ■

在/etc/modules 末尾添加 bcm2708_wdog

```
# /etc/modules: kernel modules to load at boot time.

# This file contains the names of kernel modules that should be loaded # at boot time, one per line. Lines beginning with "#" are ignored.

# Parameters can be specified after the module name.

Snd-bcm2835
bcm2708_wdog
```

喂狗程序feed.c

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <fcntl.h>
int main(void)
{
     int fd = open("/dev/watchdog", O_WRONLY);
     int res = 0;
     if (fd == -1) {
          perror("open error");
          exit(EXIT_FAILURE);
     }
     while (1) {
          printf("feed dog now!\n");
          res = write(fd, "a", 1);//写入字符"a"
          if (ret!= 1) {
               ret = -1;
               break;
          }
          sleep(5);//喂狗间隔5秒钟
     close(fd);
     return res;
}
```

2 运行程序;

```
root@raspberrypi:/home/pi# gcc feed.c -o feed
root@raspberrypi:/home/pi# ./feed
feed dog now!
```

3对程序进行验证。

退出喂狗程序,过5秒左右系统出现error,树莓派需重启!

```
feed dog now!
^Z
[1]+ Stopped
                              ./feed
